SUMMARY

AI Agent Developer and Full-Stack Engineer with 2+ years of experience building agentic AI systems and production-grade web applications. Skilled in LangChain, LangGraph, and RAG pipelines for autonomous multi-agent workflows, backed by a strong foundation in React, TypeScript, Node.js, and MongoDB.

EDUCATION

Master of Computer Applications <i>SRM Institute of Science and Technology, Chennai</i>	2024 - 2026 CGPA: 8/10
Bachelor's Degree in Information Technology <i>PSG College of Arts and Science, Bharathiar University</i>	2020 - 2023 CGPA: 7.4/10

SKILLS

AI Agent Development & Agentic AI: Designing and building autonomous AI agents with **LangChain** and **LangGraph** — agent state machines, tool-calling, memory, and multi-agent orchestration.

RAG & LLM Integration: Building **RAG** pipelines, vector-based document retrieval, and context-aware LLM applications.

Python: Strong command of Python for AI agent development, scripting, and LLM frameworks and APIs.

Front-End Development: Proficient in **React.js** for building scalable, dynamic, responsive web applications.

Back-End Development: Experienced with Node.js, Express and Nest.js for developing scalable back-end services and RESTful APIs.

TypeScript and JavaScript: Strong command of both for clean, maintainable, efficient code.

Cloud Services: AWS S3 for file storage, AWS Cognito for authentication.

Database Management: MongoDB and SQL — schema design, queries, and CRUD operations.

API Development: Building and consuming RESTful APIs for third-party integrations.

Security and Authentication: JWT-based authentication, data encryption, and secure access control.

Performance Optimization: Vite for fast build times and improved user experience.

WORK EXPERIENCE

AI Agent Developer <i>Grids and Guides Technologies - Chennai</i>	Aug 2024 – Present
- Built Kalvi40, an AI learning agent for students in grades 1–8 accepts voice input, retrieves answers via RAG over textbook PDFs and topic videos, and responds using AWS-based STT/TTS; architected with LangChain and LangGraph, guardrails for safe age-appropriate responses, and deployed on AWS AgentCore Runtime. - Developed a multi-agent system for an enterprise support platform that automates an AWS L1 engineer's ticket-resolution workflow — auto-resolves client Zoho tickets and escalates unresolved cases to senior engineers with a human-in-the-loop approval flow; built end-to-end with React.js and NestJS. - Designed a hierarchical multi-agent architecture with subagents and subgraphs to automate CEO-level operational workflows, using LangGraph to coordinate task delegation and decision-routing across specialized agents.	
Front End Developer - Level 1 <i>Trippr - Trippology Private Limited - Bengaluru</i>	May 2024 – Jul 2024
- Built scalable, component-based front-end architecture using React.js, enabling reusable UI patterns across multiple product screens. - Translated UI/UX designs into pixel-accurate, interactive web pages, ensuring visual and functional consistency across the application.	

RECENT PROJECTS

XaminityIQ | *NestJS, MongoDB Atlas, React (Vite), TypeScript, Tailwind CSS*

- Built an online examination platform for universities/colleges, covering batch, course, department, and section setup, supporting Admin, Faculty, and Student roles.
- Designed two exam modes: **Auto mode**, allowing students to attempt exams within a given window with mandatory video, audio, and screen-share recording, and **Proctoring mode**, enabling live-monitored sessions where faculty supervise and communicate in real time with up to 10 students via a dedicated monitoring UI.
- Implemented faculty evaluation assignment and result-publishing workflows, giving admins full control over evaluator allocation and result publishing.

AI-Powered IT Helpdesk Automation Platform | *LangChain, LangGraph, Python, FastAPI, MongoDB, React*

- Built an full-stack agentic AI system automating L1 IT support using a multi-agent LangGraph workflow that classifies tickets, retrieves grounded context via RAG and autonomously resolves low-risk requests through MCP tools.
- Designed a policy-driven risk engine that routes medium/high-risk requests through a tiered human-in-the-loop approval flow (Team Lead → IT Manager/Security Officer), using LangGraph's interrupt/resume capability to pause and resume agent execution around human decisions, with a full audit trail for compliance.
